

Java Assignment1

Create a Java program which will have a class called Solution with the main method.

Task1

In the same project/folder create a class called Employee with the following employee attributes

```
int empId  
string empName  
double salary  
int experience  
string designation
```

In the class which has main method get the details of 3 employees and compute the designation based on experience

```
experience >= 10 - designation="PM"  
experience > 7 and experience <= 9 - designation="PL";  
experience > 5 and experience <= 7 - designation="SSE";  
experience > 1 and experience <= 5 - designation="SE";  
experience < 1 - designation="TR";
```

The designation should be abbreviated and printed along with the designation as below. Complete this using switch case of above computed designation.

```
PM (Project Manager)  
PL(Project Lead)  
SSE (Senior Software Engineer)  
SE (Software Engineer)  
TR (Trainee)
```

Print all the details of the employees including designation in the loop.

Task2

In the above Employee class with attributes create two methods

1. ComputeDesignation
2. PrintEmployee Details

The code for computing designation from main method/function should be moved to Employee Class

ComputeDesignation method/function

The code for printing employee details from main method/function should be moved to Employee Class

PrintEmployee Details method/function .

In the main method only the looping part should be available and methods should be called from Employee class using employee object in main method inside loop for computing designation and printing details.
